

cm013 Exercise

```
suppressPackageStartupMessages(library(tidyverse))
library(gapminder)
```

Saving Graphs to File

- Don't use the mouse
- Use `ggsave` for ggplot
 - Practice by saving the following plot to file:

```
p<- ggplot(mtcars, aes(hp, wt)) +
  geom_point()
ggsave("my_plot.png", p)
```

Saving 6.5 x 4.5 in image

- Base R way: print plots “to screen”, sandwiched between `pdf()`/`jpeg()`/`png()`... and `dev.off()`.
- Vector vs. raster: Images are stored on your computer as either *vector* or *raster*.
 - **Raster**: an *n* by *m* grid of pixels, each with its own colour. `jpeg`, `png`, `gif`, `bmp`.
 - **Vector**: represented as shapes and lines. `pdf`, `svg`.
 - For tips: “10 tips for making your R graphics look their best”.

Scales; Colour

Scale functions in `ggplot2` take the form `scale_[aesthetic]_[mapping]()`.

Scale is one of the components of the grammar of graphics.

Let's first focus on the following plot:

```
p_scales <- ggplot(gapminder, aes(gdpPercap, lifeExp)) +
  geom_point(aes(colour=pop), alpha=0.2)
p_scales +
  scale_x_log10() +
  scale_colour_continuous(trans="log10")
```

1. Change the y-axis tick mark spacing to 10; change the colour spacing to include all powers of 10.

```
p_scales +
  scale_x_log10() +
  scale_colour_continuous(
    trans = "log10",
    breaks = 10^(1:10) # vector of (10, 100, 1000, 10000, ...)
  ) +
  scale_y_continuous(breaks=1:10*10)
```

2. Specify `scales::*_format` in the `labels` argument of a scale function to do the following:
 - Change the x-axis labels to dollar format (use `scales::dollar_format()`)
 - Change the colour labels to comma format (use `scales::comma_format()`)

```
library(scales)

##
## Attaching package: 'scales'
## The following object is masked from 'package:purrr':
##
##   discard
## The following object is masked from 'package:readr':
##
##   col_factor

p_scales +
  scale_x_log10(labels=dollar_format()) +
  scale_colour_continuous(
    trans = "log10",
    breaks = 10^(1:10),
    labels = comma_format()
  ) +
  scale_y_continuous(breaks=10*(1:10))
```

3. Use `RColorBrewer` to change the colour scheme.

- Notice the three different types of scales: sequential, diverging, and continuous.

All palettes the come with `RColorBrewer`:

```
RColorBrewer::display.brewer.all()
```

```
p_scales +
  scale_x_log10(labels=dollar_format()) +
  scale_color_distiller(
    trans = "log10",
    breaks = 10^(1:10),
    labels = comma_format(),
```

```

    palette = "Greens"
  ) +
  scale_y_continuous(breaks=10*(1:10))

```

4. Use `viridis` to change the colour to a colour-blind friendly scheme
 - Hint: add `scale_colour_viridis_c` (c stands for continuous; d discrete).
 - You can choose a palette with `option`.

```

p_scales +
  scale_x_log10(labels=dollar_format()) +
  scale_colour_viridis_c(
    trans = "log10",
    breaks = 10^(1:10),
    labels = comma_format()
  ) +
  scale_y_continuous(breaks=10*(1:10))

```

Theming

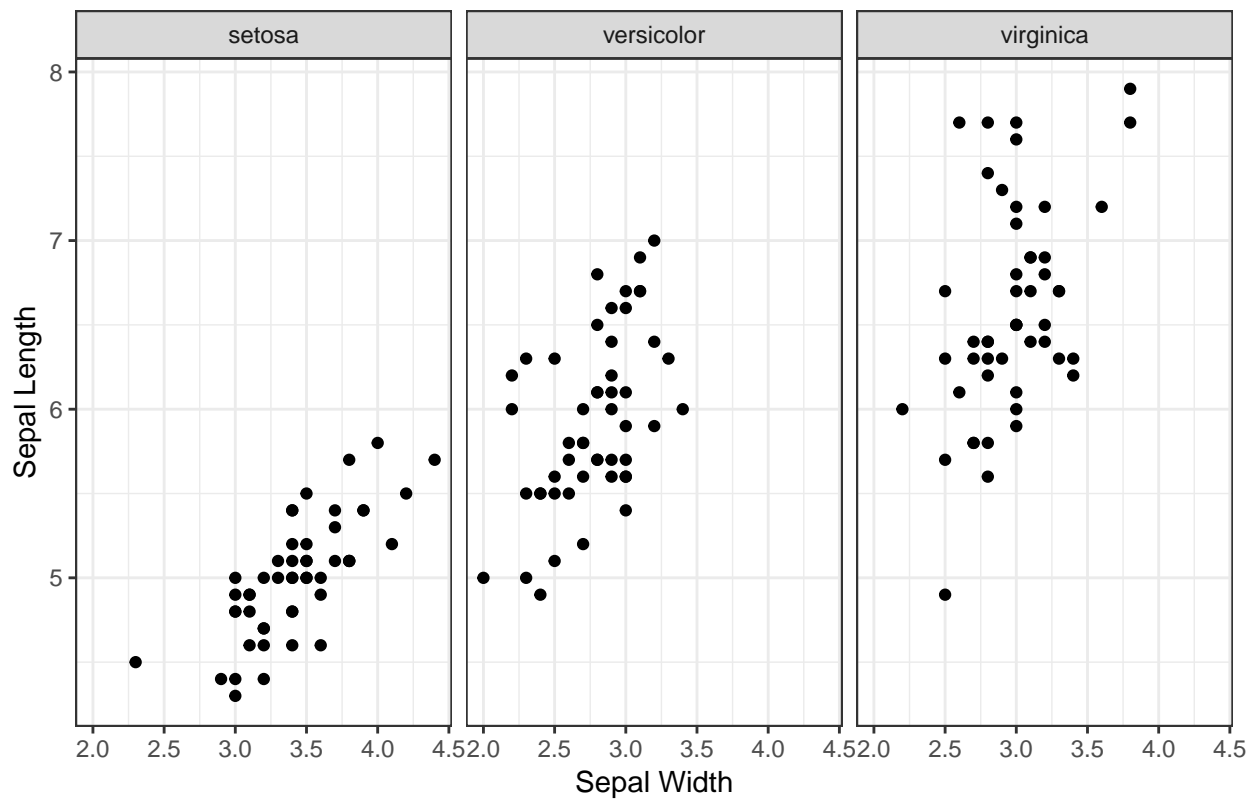

Changing the look of a graphic can be achieved through the `theme()` layer.

There are “complete themes” that come with `ggplot2`, my favourite being `theme_bw` (I’ve grown tired of the default gray background, so `theme_bw` is refreshing).

1. Change the theme of the following plot to `theme_bw()`:

```
ggplot(iris, aes(Sepal.Width, Sepal.Length)) +
  facet_wrap(~ Species) +
  geom_point() +
  labs(x = "Sepal Width",
       y = "Sepal Length",
       title = "Sepal sizes of three plant species") +
  theme_bw()
```

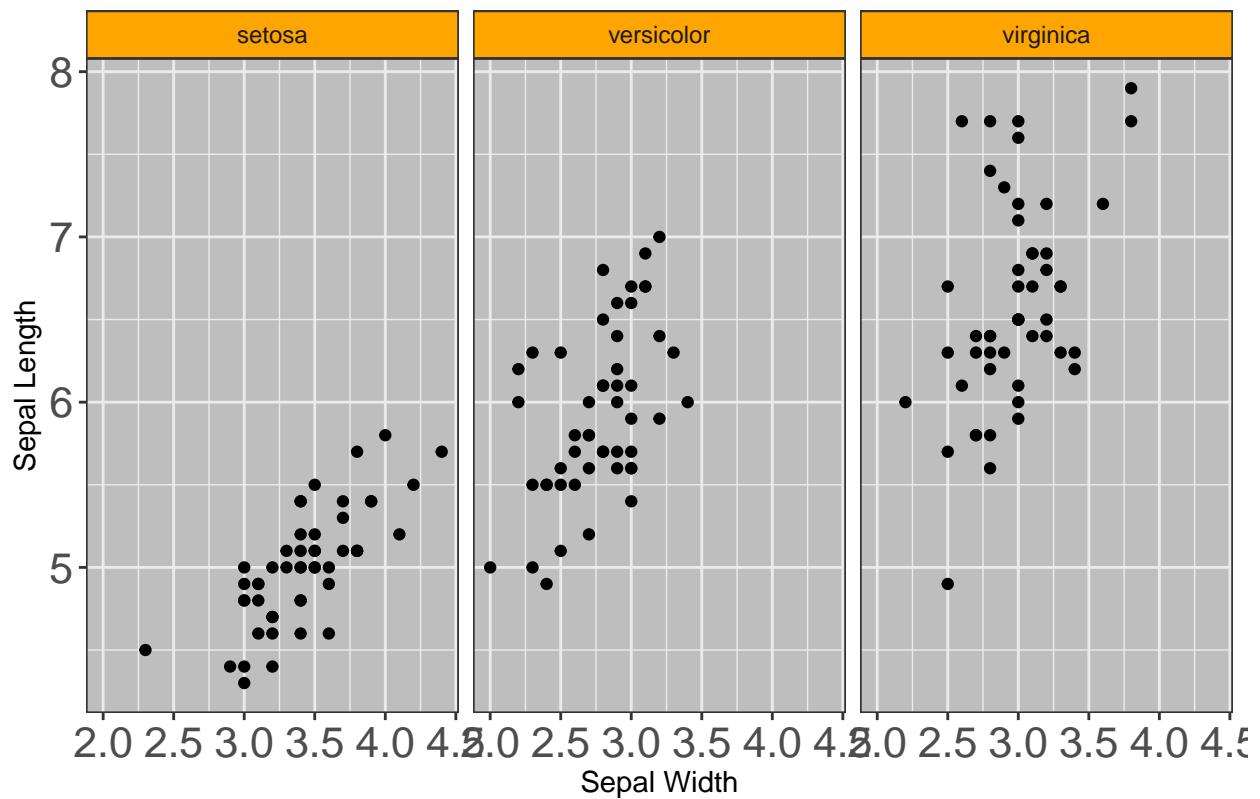

Sepal sizes of three plant species

2. Then, change font size of axis labels, and the strip background colour. Others?

```
ggplot(iris, aes(Sepal.Width, Sepal.Length)) +
  facet_wrap(~ Species) +
  geom_point() +
  labs(x = "Sepal Width",
       y = "Sepal Length",
       title = "Sepal sizes of three plant species") +
  theme_bw() +
  theme(axis.text = element_text(size = 16) ,
        strip.background = element_rect(fill = "orange"),
        panel.background = element_rect(fill = "grey")) # change aspects of plot in theme()
```

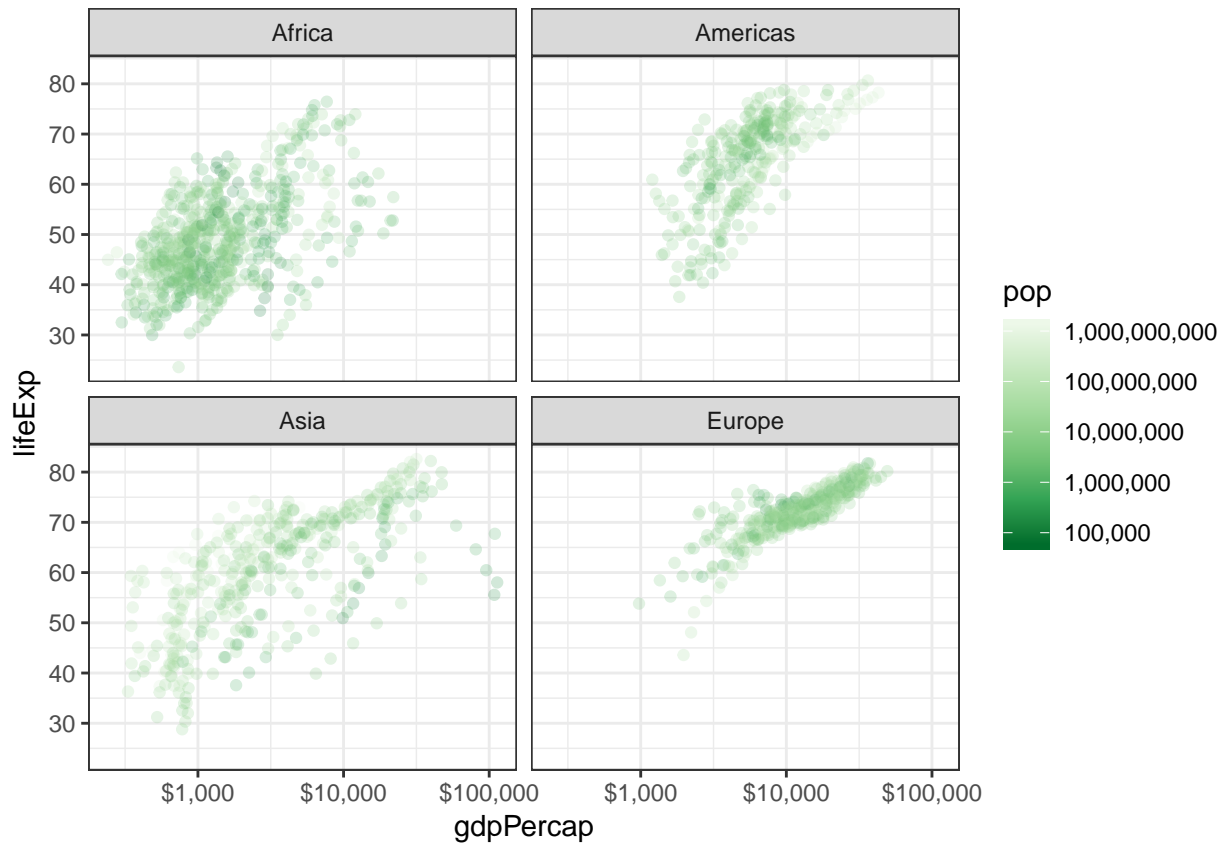

Sepal sizes of three plant species

Plotly

Consider the following plot:

```
(p <- gapminder %>%
  filter(continent != "Oceania") %>%
  ggplot(aes(gdpPercap, lifeExp)) +
  geom_point(aes(colour=pop), alpha=0.2) +
  scale_x_log10(labels=dollar_format()) +
  scale_colour_distiller(
    trans = "log10",
    breaks = 10^(1:10),
    labels = comma_format(),
    palette = "Greens"
  ) +
  facet_wrap(~ continent) +
  scale_y_continuous(breaks=10*(1:10)) +
  theme_bw())
```

1. Convert it to a plotly object by applying the `ggplotly()` function:

```
library(plotly)
```

```
##
## Attaching package: 'plotly'
## The following object is masked from 'package:ggplot2':
##
##   last_plot
## The following object is masked from 'package:stats':
##
##   filter
## The following object is masked from 'package:graphics':
##
##   layout
```

```
ggplotly(p)
```

2. You can save a plotly graph locally as an html file. Try saving the above:

- NOTE: plotly graphs don't seem to show up in Rmd *notebooks*, but they do with Rmd *documents*.

```
# p %>%
#   ggplotly() %>%
#   htmlwidgets::saveWidget("cm013-exercise_files/plotly.html")
```

3. Run this code to see the json format underneath:

```
p %>%
```

```
  ggplotly() %>%
```

```
  plotly_json()
```

```

```

4. Check out code to make a plotly object from scratch using `plot_ly()` – scatterplot of `gdpPercap` vs `lifeExp`.
 - Check out the cheat sheet.

```
plot_ly(gapminder,
  x = ~gdpPercap,
  y = ~lifeExp,
  type = "scatter",
  mode = "markers",
  opacity = 0.2) %>%
  layout(xaxis = list(type = "log"))
```

5. Add population to form a z-axis for a 3D plot:

```
plot_ly(gapminder,
  x = ~gdpPercap,
  y = ~lifeExp,
  z = ~pop,
  type = "scatter3d",
  mode = "markers",
```

```
opacity = 0.2)
```
